

## Compare RNN vs LLaMA

Model	Accuracy	Strengths	Weaknesses
RNN	0.8594	<ul style="list-style-type: none"><li>- Simple architecture, easy to implement and train.</li><li>- Low computational cost, can run on CPU.</li><li>- Works well for small datasets.</li><li>- Fast inference for short sequences.</li></ul>	<ul style="list-style-type: none"><li>- Lower accuracy on complex language patterns (context, sarcasm, etc.).</li><li>- Struggles with long-term dependencies.</li><li>- Limited generalization compared to pretrained LLMs.</li><li>- Requires feature engineering (e.g., tokenization, embeddings).</li></ul>
LLaMA (pretrained)	0.8600	<ul style="list-style-type: none"><li>- Pretrained on massive text corpora, captures semantic meaning effectively.</li><li>- High accuracy even on small fine-tuning datasets.</li><li>- Understands context, sarcasm, and nuanced language.</li><li>- Handles long sequences better than RNNs.</li><li>- Easy to use with Python SDK.</li></ul>	<ul style="list-style-type: none"><li>- Requires GPU for fast inference (CPU possible but slower).</li><li>- Larger model size increases memory.</li><li>- Slower training/fine-tuning.</li><li>- Dependent on external libraries and API support.</li></ul>
